

Let X_1, X_2, \dots, X_n be a random sample from the normal distribution with mean μ and known variance σ^2 .

Consider testing the simple versus simple hypotheses

$$H_0 : \mu = 3$$

$$H_1 : \mu = 5$$

$$H_0 : \mu = 3$$

$$H_1 : \mu = 5$$

Definition/Notation:

Let $\alpha = P(\text{Type I Error})$

$= P(\text{Reject } H_0 \text{ when it's true})$

$= P(\text{Reject } H_0 \text{ when } \mu = 3)$

α is called the **level of significance** of the test.

It is also sometimes referred to as the **size** of the test.

Developing a Test

$$H_0 : \mu = 3$$

$$H_1 : \mu = 5$$

Step One:

Choose an estimator for μ .

$$\hat{\mu} = \bar{X}$$

Step Two:

Give the “form” of the test.

The form of the test:

$$H_0 : \mu = 3$$

$$H_1 : \mu = 5$$

- We are looking for evidence that H_1 is true.
- The $N(3, \sigma^2)$ distribution takes on values from $-\infty$ to ∞ .
- $\bar{X} \sim N(\mu, \sigma^2/n) \Rightarrow \bar{X}$ also takes on values from $-\infty$ to ∞ .

The form of the test:

$$H_0 : \mu = 3$$

$$H_1 : \mu = 5$$

- It is entirely possible that \bar{X} is very large even if the mean of its distribution is 3.
- However, if \bar{X} is very large, it will start to seem more likely that μ is larger than 3.
- Eventually, a population mean of 5 will seem more likely than a population mean of 3.

Developing a Test

$$H_0 : \mu = 3$$

$$H_1 : \mu = 5$$

Step One:

Choose an estimator for μ .

$$\hat{\mu} = \bar{X}$$

Step Two:

Give the “form” of the test.

Reject H_0 , in favor of H_1 , if $\bar{X} > c$
for some c to be determined.

Developing a Test

$$H_0 : \mu = 3$$

$$H_1 : \mu = 5$$

Step Three:

Find c .

Reject H_0 , in favor of H_1 , if $\bar{X} > c$.

- If c is too large, we are making it difficult to reject H_0 .

We are more likely to fail to reject when it should be rejected.

Type II Error

Developing a Test

$$H_0 : \mu = 3$$

$$H_1 : \mu = 5$$

Step Three:

Find c .

Reject H_0 , in favor of H_1 , if $\bar{X} > c$.

- If c is too small, we are making it too easy to reject H_0 .

We are more likely reject when it should not be rejected.

Type I Error

Developing a Test

$$H_0 : \mu = 3$$

$$H_1 : \mu = 5$$

Step Three:

Find c .

Reject H_0 , in favor of H_1 , if $\bar{X} > c$.

This is where α comes in.

$$\alpha = P(\text{Type I Error})$$

$$= P(\text{Reject } H_0 \text{ when true})$$

$$= P(\bar{X} > c \text{ when } \mu = 3)$$

Developing a Test

$$H_0 : \mu = 3$$

$$H_1 : \mu = 5$$

Step Four:

Give a conclusion!

Example: $X_1, X_2, \dots, X_{10} \stackrel{\text{iid}}{\sim} N(\mu, 4)$

Find a hypothesis test for

$$H_0 : \mu = 5 \quad \text{vs} \quad H_1 : \mu = 3$$

Use level of significance $\alpha = 0.05$.

Find a “test of size 0.05”.

Example:

$$H_0 : \mu = 5$$

$$H_1 : \mu = 3$$

Step One:

Choose an estimator for μ .

$$\hat{\mu} = \bar{X}$$

Step Two:

Give the “form” of the test.

Reject H_0 , in favor of H_1 , if $\bar{X} < c$ for some c to be determined.

Example:

$$H_0 : \mu = 5$$

$$H_1 : \mu = 3$$

Step Three:

Find c.

$$0.05 = P(\text{Type I Error})$$

$$= P(\text{Reject } H_0 \text{ when true})$$

$$= P(\bar{X} < c \text{ when } \mu = 5)$$

$$= P\left(\frac{\bar{X} - \mu_0}{\sigma/\sqrt{n}} < \frac{c - 5}{2/\sqrt{10}} \text{ when } \mu = 5\right)$$

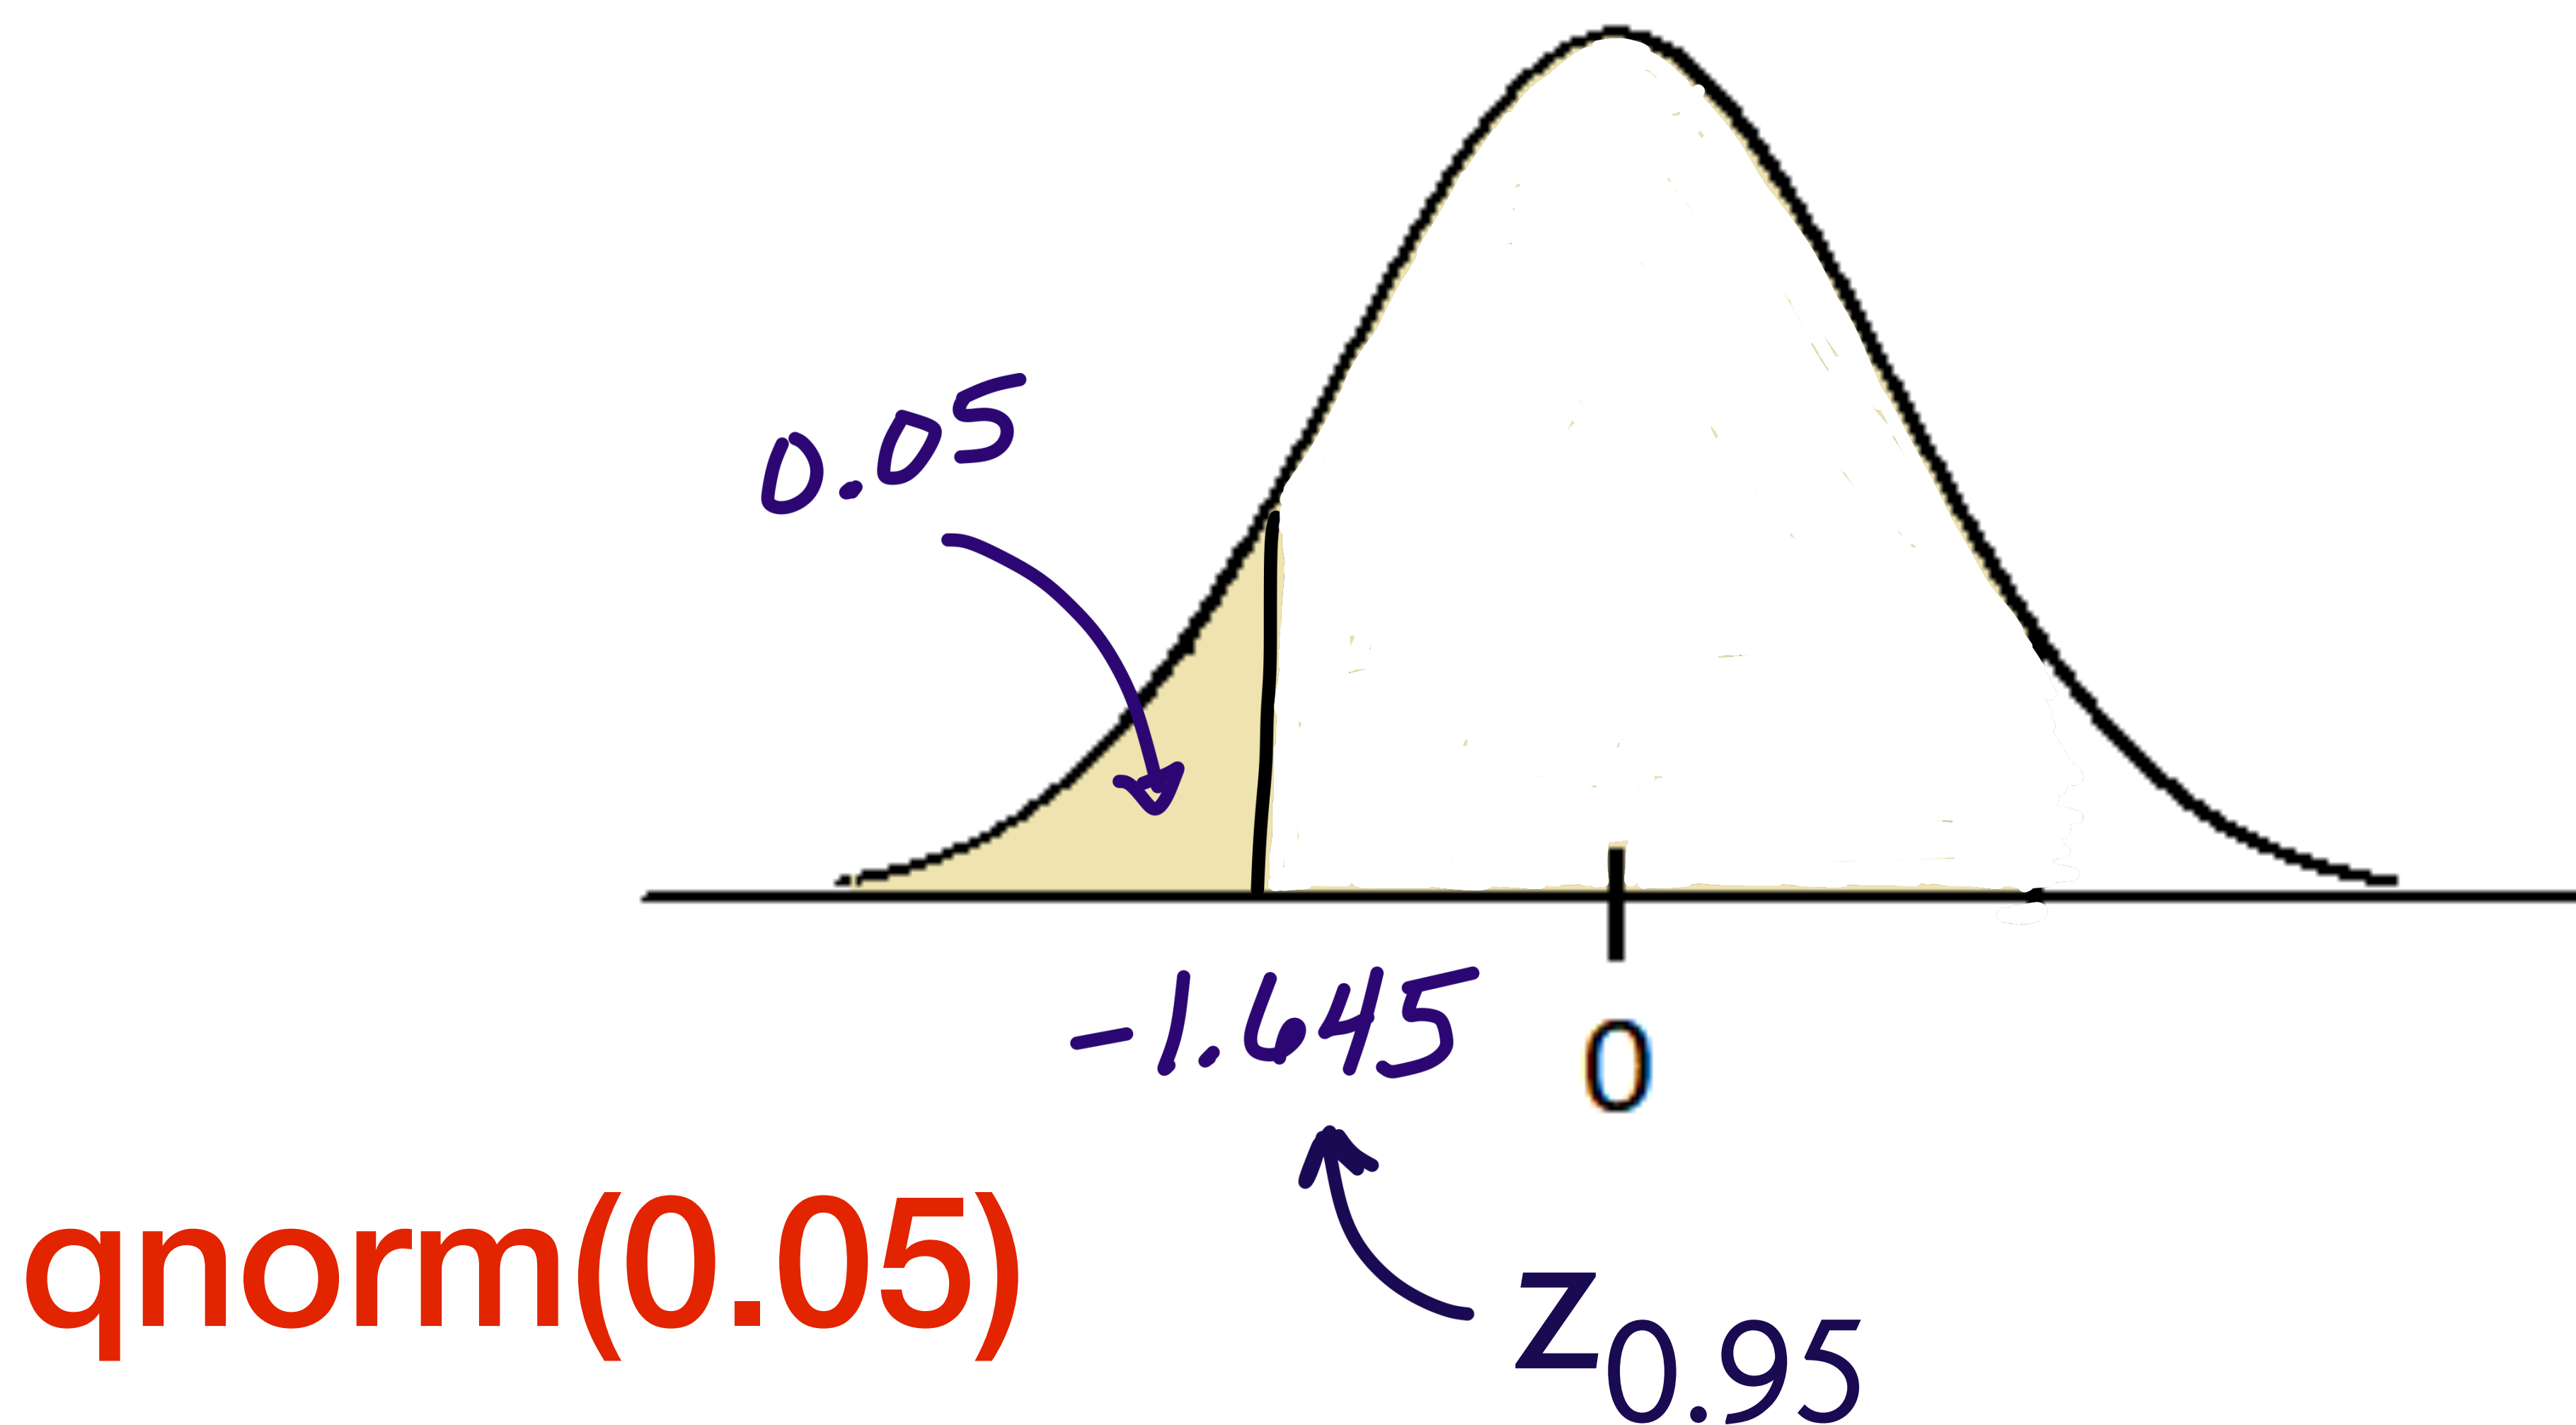

Example:

$$H_0 : \mu = 5$$

$$H_1 : \mu = 3$$

Step Three:

Find c. $0.05 = P\left(Z < \frac{c - 5}{2/\sqrt{10}}\right)$

Example:

$$H_0 : \mu = 5$$

$$H_1 : \mu = 3$$

Step Three:

Find c.

$$0.05 = P\left(Z < \frac{c - 5}{2/\sqrt{10}}\right)$$

$$\Rightarrow \frac{c - 5}{2/\sqrt{10}} = -1.645$$

$$\Rightarrow c = 3.9596$$

Example:

$$H_0 : \mu = 5$$

$$H_1 : \mu = 3$$

Step Four:

Give a conclusion.

Reject H_0 , in favor of H_1 , if

$$\bar{X} < 3.9596$$
